

FUNCTIONAL & PERFORMANCE TESTING

Standard Laptop Procurement Automation • ServiceNow Flow Designer

Date 30 September 2026	Team ID 6ab7efd38c7c66e706728f94	Project Name Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer	Module Standard Laptop Procurement Automation	Platform ServiceNow Flow Designer
----------------------------------	--	--	---	---

TESTING OBJECTIVE

The purpose of testing is to verify that the automated laptop procurement workflow performs correctly across request creation, approval routing, inventory validation, purchase order generation, notifications, and fulfillment activities while maintaining acceptable performance under normal workload conditions.

FUNCTIONAL TEST CASES

Test ID	Scenario	Test Procedure	Expected Result	Actual Result	Status
FT-01	Service Catalog Request Creation	Submit a standard laptop request through Service Portal	Request record and RITM are created successfully	As Expected	Pass
FT-02	Eligibility Validation	Submit request using eligible employee account	System validates user eligibility automatically	As Expected	Pass
FT-03	Approval Workflow	Submit request requiring manager approval	Approval task routed to designated approver	As Expected	Pass
FT-04	Auto Approval Processing	Submit request meeting policy criteria	Request approved automatically without manual intervention	As Expected	Pass
FT-05	Inventory Verification	Trigger workflow with available stock	Available inventory identified correctly	As Expected	Pass
FT-06	Purchase Order Creation	Submit request when inventory is unavailable	Purchase order generated automatically	As Expected	Pass
FT-07	Vendor Integration	Send purchase order to vendor system	Order details transmitted successfully	As Expected	Pass
FT-08	Notification Service	Trigger workflow progression	Email notifications delivered at each stage	As Expected	Pass
FT-09	Asset Registration	Complete delivery process	Asset record created and linked to requester	As Expected	Pass
FT-10	Request Closure	Confirm laptop delivery	Request automatically closed after fulfillment	As Expected	Pass

The test scenarios were derived from the system requirements, solution workflow, user stories, and solution architecture documentation.

PERFORMANCE VALIDATION & TEST RESULTS

Response speed • concurrency • reliability • workflow scalability

PERFORMANCE TEST CASES

Test ID	Scenario	Test Procedure	Expected Result	Actual Result	Status
PT-01	Request Processing Time	Submit new laptop request	Request created within 3 seconds	Within Limit	Pass
PT-02	Approval Processing Speed	Trigger automated approval workflow	Approval completed within 5 seconds	Within Limit	Pass
PT-03	Concurrent Request Test	Submit multiple requests simultaneously	System processes requests without failures	Stable	Pass
PT-04	Notification Delivery Time	Generate workflow notifications	Notifications dispatched within acceptable delay	Within Limit	Pass
PT-05	Inventory Check Performance	Execute inventory validation process repeatedly	Inventory lookup completes quickly	Within Limit	Pass
PT-06	Workflow Scalability Test	Process high request volume	System remains responsive and stable	Stable	Pass
PT-07	End-to-End Transaction Test	Execute complete request lifecycle	Successful completion without workflow interruption	Successful	Pass

TEST RESULTS SUMMARY

CATEGORY	TOTAL TESTS	PASSED	FAILED	SUCCESS RATE
Functional Testing	10	10	0	100%
Performance Testing	7	7	0	100%

VALIDATION OUTCOME

Functional Coverage	Performance Outcome
The automated procurement workflow successfully fulfilled all major functional requirements. - Catalog-based laptop request submission - Automated approval routing - Inventory validation - Procurement automation - Notification delivery - Asset registration - Request closure management	The solution achieved the defined target performance levels with reliable workflow execution and acceptable processing time under simulated workload conditions.

ARCHITECTURE REFERENCE

The testing activities validated the workflow stages described in the solution architecture: Request Creation → Approval Processing → Inventory Checks → Procurement Execution → Delivery & Closure. Validation covered the Service Portal interface, Flow Designer automation, ServiceNow data/CMDB, vendor integration, email services, and the resulting asset/request state.
--

SUPPORTING REFERENCES

The supporting project diagrams and solution artifacts are intended to substantiate workflow validation, integration testing, and process verification activities performed during the testing phase.
